Example critique — made up for testing ScholarPath

This is a made-up example critique of an imaginary study. It exists only to test the Critique Study Studio.

1. Summary

The study examined how twenty secondary-school students used an AI writing assistant for four weeks. The researchers analysed drafts and interviews to understand how students used the feedback.

The authors report that students accepted most grammar suggestions but ignored most suggestions about structure.

2. Methodology

The use of non-probability sampling may limit the generalizability of the findings. Only twenty students from one school took part.

However, the combination of drafts and interviews is a strength, because it shows both what students did and why they did it.

3. Recommendations

Future research should repeat the study with a larger, randomly selected sample and should measure learning over a full term.
